

In this guide, we will be using AWS Free tier to setup and SSH into a Linux Ubuntu server. Keep in mind that AWS Free tier only lasts for 1 year. After this, you will start getting charged for any running instances.

Prerequisites:

- AWS account with attached payment information
- PuTTY and PuTTYgen. Download can be found at <https://www.PuTTY.org> (you will be navigated to a different site to download it, but it is safe)

Time needed: 1 hour

- 1) Create AWS account
 - Navigate to <https://aws.amazon.com>
 - Click on My Account at the top and Choose 'AWS Management Console'
 - Hover over Services and select EC2

- 2) Click on 'Launch Instance'

EC2 Dashboard

- Events
- Tags
- Reports
- Limits
- INSTANCES
 - Instances
 - Launch Templates
 - Spot Requests
 - Reserved Instances
 - Dedicated Hosts
 - Capacity Reservations
- IMAGES
 - AMIs
 - Bundle Tasks

Resources

You are using the following Amazon EC2 resources in the US East (Ohio) region:

0 Running Instances	0 Elastic IPs
0 Dedicated Hosts	0 Snapshots
0 Volumes	0 Load Balancers
0 Key Pairs	1 Security Groups
0 Placement Groups	

Learn more about the latest in AWS Compute from AWS re:Invent by viewing the [EC2 Videos](#).

Create Instance

To start using Amazon EC2 you will want to launch a virtual server, known as an Amazon EC2 instance.

Launch Instance

3) Type 'ubuntu' in the search bar and then select the Ubuntu Server 18.04 (Free tier eligible)

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 1: Choose an Amazon Machine Image (AMI) [Cancel and Exit](#)

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. You can select an AMI provided by AWS, our user community, or the AWS Marketplace; or you can select one of your own AMIs.

Search:

Quick Start (7)

- My AMIs (0)
- AWS Marketplace (192)
- Community AMIs (9399)

Ubuntu Server 18.04 LTS (HVM), SSD Volume Type - [ami-0f65671a86f061fcd \(64-bit x86\) / ami-0f2057f28f0a44d06 \(64-bit Arm\)](#)

Free tier eligible

Ubuntu Server 18.04 LTS (HVM),EBS General Purpose (SSD) Volume Type. Support available from Canonical (<http://www.ubuntu.com/cloud>)

☒ 64-bit (x86) ☐ 64-bit (Arm)

Select

4) The Free tier option should be chosen by default. Click Next: Configure Instance Details

Filter by: All instance types Current generation [Show/Hide Columns](#)

Currently selected: t2.micro (Variable ECUs, 1 vCPUs, 2.5 GHz, Intel Xeon Family, 1 GiB memory, EBS only)

	Family	Type	vCPUs	Memory (GiB)	Instance Storage (GB)	EBS-Optimized Available	Network Performance
<input type="checkbox"/>	General purpose	t2.nano	1	0.5	EBS only	-	Low to Moderate
<input checked="" type="checkbox"/>	General purpose	t2.micro <small>Free tier eligible</small>	1	1	EBS only	-	Low to Moderate

5) Configure Instance: No need to change anything here. Click Next: Add Storage

6)

- You currently get 30GB of storage on free tier. Since you can only have one EC2 instance running 24/7 for free, I choose to change this from 8GB to 30GB.
- Click Next: Add Tags

1. Choose AMI 2. Choose Instance Type 3. Configure Instance **4. Add Storage** 5. Add Tags 6. Configure Security Group 7. Review

Step 4: Add Storage

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more](#) about storage options in Amazon EC2.

Volume Type	Device	Snapshot	Size (GiB)	Volume Type	IOPS	Throughput (MB/s)	Delete on Termination	Encrypt
Root	/dev/xvda	snap-040ce2c3f0d1a8f58	30	General Purpose	100 / 3000	N/A	<input checked="" type="checkbox"/>	Not Encrypted

[Add New Volume](#)

7) Click Next: Configure Security Group. Click 'Add Rule' button and input 25565 in 'Port Range' and change 'Source' to 'Anywhere'

Step 6: Configure Security Group

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more](#) about Amazon EC2 security groups.

Assign a security group: ☒ Create a **new** security group

☐ Select an **existing** security group

Security group name:

Description:

Type <small>i</small>	Protocol <small>i</small>	Port Range <small>i</small>	Source <small>i</small>	Description <small>i</small>
SSH <small>v</small>	TCP	22	Custom <small>v</small> 0.0.0.0/0	e.g. SSH for Admin De
Custom TCP F <small>v</small>	TCP	25565	Anywhere <small>v</small> 0.0.0.0, ::/0	e.g. SSH for Admin De

Add Rule

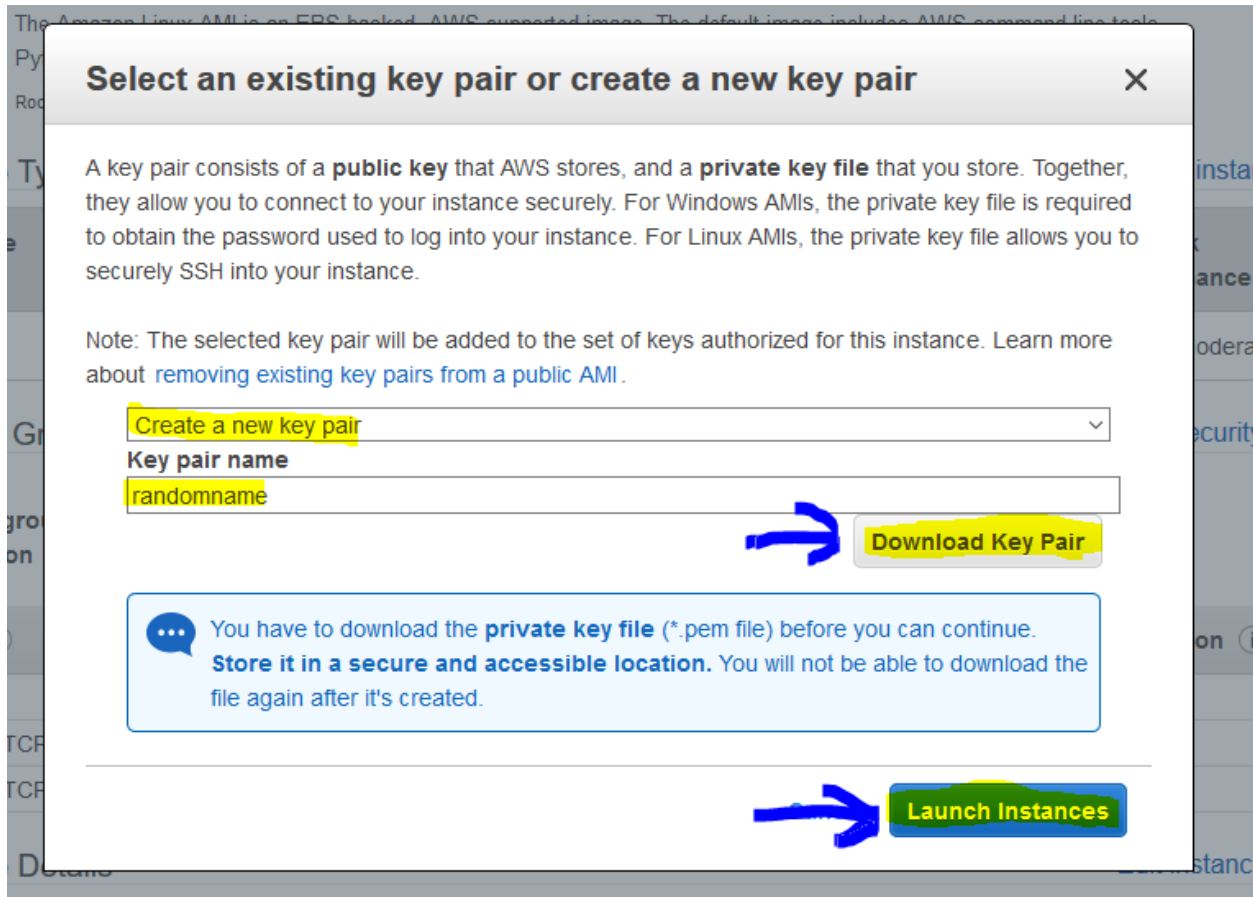

Warning

Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

8) Click Review and Launch

- Verify everything is correct
- Click 'Launch'. You will get the screen below
- Select 'Create a new key pair' and name it whatever you want
- Click Download Key Pair and save it somewhere you can access it
- Click Launch Instances
- Click View Instances

SSH To Instance:

****The following steps 9 & 10 are for Windows users only. If you aren't using Windows or prefer a different guide, check out Amazon's guides here:**

<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AccessingInstances.html>

9) Open PuTTYgen.exe

- Click 'Load' and navigate to the folder where you downloaded the Key Pair to
- If using Windows, make sure select 'All Files' in the bottom right in order to see your key
- Choose your key and click 'Open'. You should get message "Successfully imported foreign key..."

Name	Date modified	Type	Size
 randomname.pem	1/14/2019 12:35 PM	PEM File	2 KB

File name: randomname.pem

All Files (*.*)

Open Cancel

- Now click 'Save private key'. You can add a passphrase if you want, but I usually don't. If you are worried about someone getting their hands on your key, then you should add a passphrase.

Key passphrase:

Confirm passphrase:

Actions

Generate a public/private key pair

Load an existing private key file

Save the generated key

- Name this new key. I usually use the same name as the .pem file. This file should save as a .ppk
- Click Save

This PC

Network

File name: randomname

Save as type: PuTTY Private Key Files (*.ppk)

Hide Folders

Save Cancel

10) Open PuTTY.exe

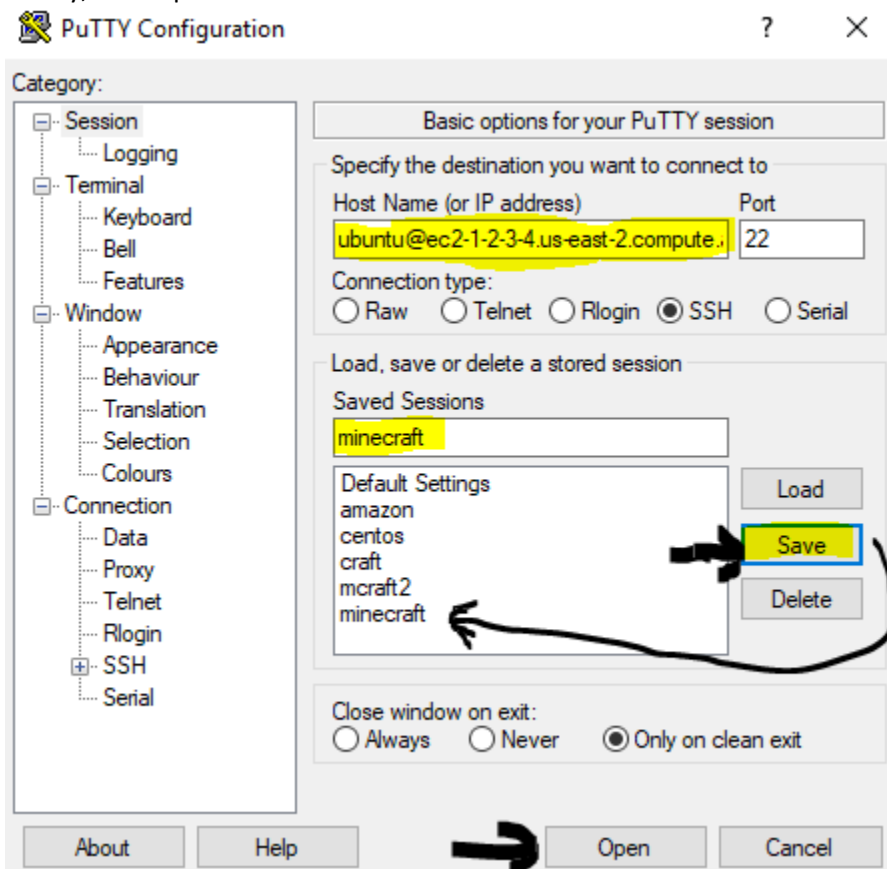

- Expand 'SSH' towards the bottom. Then click on 'Auth'
- On the right hand side, click 'Browse', and select your newly created .ppk key file
- Scroll back up to the top of PuTTY and click on 'Session'.

- Go back to your browser where we created the Ubuntu server on aws, and locate the instance we just created (Services >> EC2 >> Instances (or 'Running instances')) . You should see your instance here, and what we are looking for is the Public DNS. Copy this field, starting with 'ec2' and ending with '.com' which should look similar to the below picture

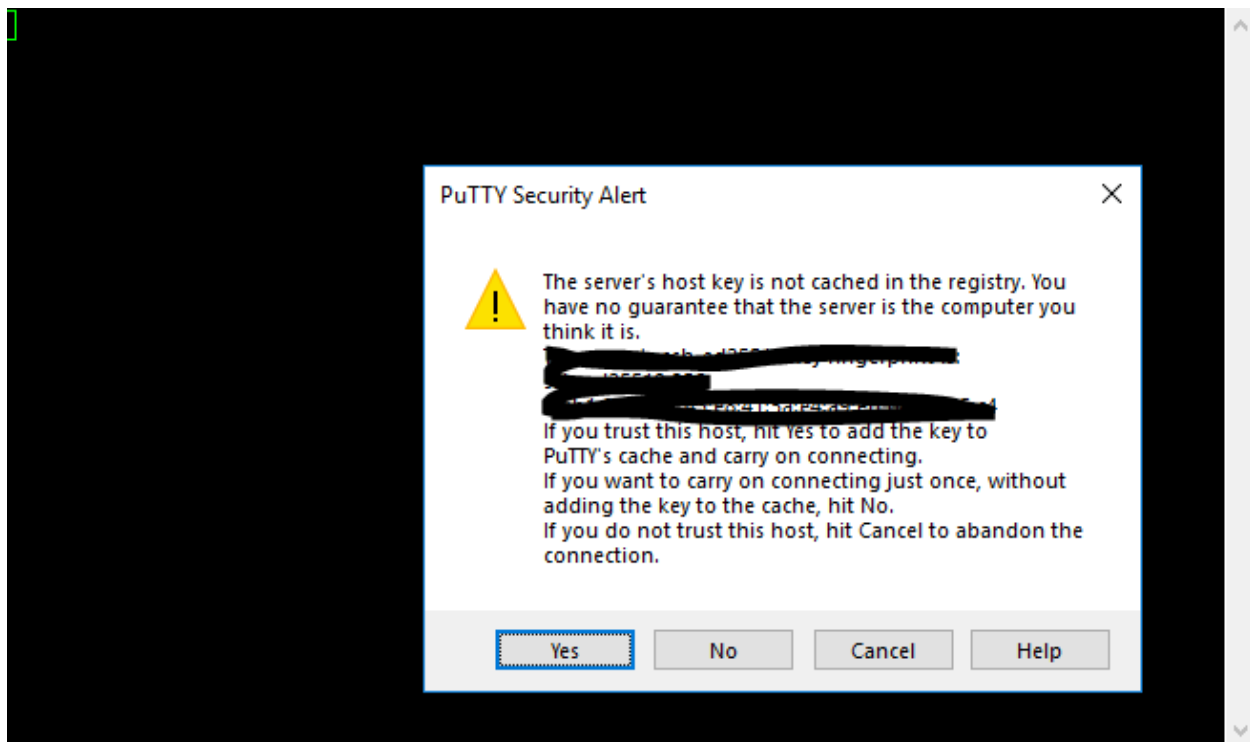

Public DNS (IPv4)

ec2-██████████.us-east-2.compute.amazonaws.com

- Tab back to PuTTY. In the 'Host Name (or IP address)' box , paste the DNS. Then, prepend 'ubuntu@' to the DNS. So, if your DNS is ec2-1-2-3-4.us-east-2.compute.amazonaws.com, your box should look like ubuntu@ec2-1-2-3-4.us-east-2.compute.amazonaws.com
- You can save this config for future use by giving it a name under 'Saved Sessions' and clicking Save (shown below)
- Finally, click Open

- You will receive the below security alert. Click 'Yes'

- For more info on connecting to your server instance from Windows using PuTTY, check out Amazon's guide here <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/putty.html>

By now you should be connected to your server. If you had any issues following this guide, try looking at Amazon's User Guide here:

<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AccessingInstancesLinux.html>
